Task #01 (Language Overview)

(Purpose)

⇒ Pakwaan++ is a ~~new~~ cooking based programming language. Main idea of this language is to connect programming with daily life cooking so beginner can easily understand the logic like following a recipe. Programming statements work like cooking steps such as preparing ingredients, checking conditions and serving food.

(Syntax style)

→ The syntax style of Pakwaan++ is similar to C++ but cooking related. Urdu keywords are used to make the language easy and interesting.

(Reason for choosing your keywords)

→ These keywords are chosen because they are meaningful and easy to remember. When students read the code it feels like reading cooking instructions.

From Phase 1

5 keywords

Pakaa Shuru

Agar Halat

Jabtak Ghoom

Pura Hissa

Davast Pesh

3 operators

+ (Add)

- (Remove)

/ (Divide)

Punctuation

{ } (Block start/end)

; (instruction end)

()

Task #02 (Grammar Definition) (CFG)

(Non-terminals)

$\langle \text{Program} \rangle$, $\langle \text{RecipeBlock} \rangle$, $\langle \text{steplist} \rangle$, $\langle \text{step} \rangle$
 $\langle \text{Decl} \rangle$, $\langle \text{Assign} \rangle$, $\langle \text{ifcond} \rangle$, $\langle \text{loop} \rangle$, $\langle \text{output} \rangle$, $\langle \text{Expr} \rangle$

Task #03 (Sample Production Rule)

$\langle \text{Program} \rangle \rightarrow \text{Pakai shuru} () \langle \text{RecipeBlock} \rangle$

$\langle \text{RecipeBlock} \rangle \rightarrow \{ \langle \text{steplist} \rangle \}$

$\langle \text{steplist} \rangle \rightarrow \langle \text{step} \rangle \langle \text{steplist} \rangle \mid \epsilon$

$\langle \text{step} \rangle \rightarrow \langle \text{Decl} \rangle \mid \langle \text{Assign} \rangle \mid \langle \text{ifcond} \rangle \mid \langle \text{loop} \rangle \mid \langle \text{output} \rangle$

$\langle \text{Decl} \rangle \rightarrow \text{Pura Hissa identifier};$

$\langle \text{Assign} \rangle \rightarrow \text{identifier} = \langle \text{Expr} \rangle;$

$\langle \text{ifcond} \rangle \rightarrow \text{Agr Halat} (\langle \text{Expr} \rangle) \langle \text{RecipeBlock} \rangle$

$\langle \text{loop} \rangle \rightarrow \text{Jabtak Ghaam} (\langle \text{Expr} \rangle) \langle \text{RecipeBlock} \rangle$

$\langle \text{output} \rangle \rightarrow \text{Dawat Pesh identifier};$

$\langle \text{Expr} \rangle \rightarrow \text{identifier} \mid \text{integer} \mid \text{identifier} + \text{identifier}$

Task # 04 (First and follow sets)

① 1st Non-Terminal = $\langle \text{Step} \rangle$

$\langle \text{Step} \rangle \rightarrow \langle \text{Decl} \rangle / \langle \text{Assign} \rangle / \langle \text{If Cond} \rangle / \langle \text{Loop} \rangle / \langle \text{Output} \rangle$

First($\langle \text{Step} \rangle$) =
{ Purattissa, identifier, Agar Haled,
Jabtak Ghoom, Dawat Pesh }

\Rightarrow each product of step
starts with different keyword that
why it's in first set.

② 2nd Non-terminal = $\langle \text{StepList} \rangle$

First($\langle \text{StepList} \rangle$) =

{ Purattissa, identifier, Agar Haled, Jabtak Ghoom,
Dawat Pesh, ϵ }

(Production)

$\langle \text{StepList} \rangle \rightarrow \langle \text{step} \rangle \langle \text{StepList} \rangle / \epsilon$

Follow($\langle \text{StepList} \rangle$) = { }

\Rightarrow $\langle \text{StepList} \rangle$ is used inside $\langle \text{RecipeBlock} \rangle \rightarrow \{ \langle \text{StepList} \rangle \}$
so after $\langle \text{StepList} \rangle$, the closing brace $\}$ can appear,
which is included in the follow set

Task #05 (Ambiguity check)

Q Is the grammar Ambiguous

NO, the grammar is not ambiguous

⇒ Because every statement starts with a unique keyword or identifier such as Pura Hissa. So there is no confusing in selecting production rule so the grammar is clear and deterministic.

Task #06 (Parse Tree Construction)

Program

Pakcaai Shuru () {

 Pura Hissa biryani ;

 biryani = 5 ;

 Agar Halat (biryani) {

 Dawat Pesh biryani ;

 }

}

(Parse Tree)

Task # 07 (Error Scenarios)

① Error Snippet :-

Pura Hissa chair

→ line 2

→ Rule violated → Decl → Pura Hissa identifier ;

→ Expected token → ; at end

② Error Snippet

Agar Halat chair {

line → 2

Rule violated → If cond → Agar Halat (< Expr >) { Respn

Expected token → (
